REGISTRAR

PRESIDENCY UNIVERSITY

Private University Estd. in Karnataka State by Act No. 41 of 2013

1. Screen Shots of Peer learning Class Session- I on 17/12/22

Topics, covered: Module-2 Types of species - Extinct, endemic, endangered, and rare species, their interaction with each other; Threats and conservation of biodiversity.

Questions given for preparation:

1. Biodiversity is under severe threat because of both natural causes and excessive human interference. What kind of conservative measures can be considered to preserve the biodiversity?
2. Species interaction is the direct or indirect interrelationship or association between different organisms of an ecosystem. Explain and name the type of interaction that can be observed in each of the following examples:
 - (a) Ascaris in human intestine.
 - (b) Butterfly and flower

Number of students, attended: 16

City Office: University House, 8/1, King Street, Richmond Town, Bengaluru - 560025

Campus: Presidency University, Itgalpur, Rajankunte, Bengaluru - 560064

POLYTHIOPHENES (PT)- SYNTHESIS AND APPLICATION

ABSTRACT:

Conducting polymers are extensively studied due to their outstanding properties, including tunable electrical property, optical and high mechanical properties, easy synthesis and effortless fabrication and high environmental stability over conventional inorganic materials. Conducting polymers, such as polythiophene, have garnered significant interest due to their unique electronic, optical, and mechanical properties and their potential applications in various fields, including electronics, energy storage, and sensing. This paper provides an overview of the current state of research on conducting polymer (POLYTHIOPHENE), including their synthesis and applications.

Conducting polymers offer unique opportunities for the development of flexible and lightweight electronic devices. Their tunable properties, processability, and potential for large-scale production make them attractive for various applications in organic electronics. Further research and technological advancements are expected to unlock the full potential of conducting polymers in the field of electronic and optoelectronic devices.

INTRODUCTION:

Most of the polymers known are non-conductive. The invention of conducting polymer changed the future of polymers. Henry Letheby, an English chemist, described the first Conductive polymer, Polyaniline in the mid-19th century. Conductive polymers are also called as intrinsically conductive polymers (ICPs). These compounds have metallic conductivity or can act as semiconductors. Typical conducting polymers include polyacetylene (PA), polyaniline (PANI), polypyrrole (PPy), polythiophene (PT), poly(para-phenylene) (PPP), poly(phenylenevinylene) (PPV), and polyfuran (PF). Here in this review we will be further looking into the synthesis, applications and properties of Polythiophene(PT)¹.

Polythiophene is a semiconducting polymer that has attracted considerable interest due to its remarkable electronic and optical properties. This paper focuses on recent advances in the synthesis of polythiophene. The paper also highlights the applications of polythiophene in various fields, such as Biosensors and Photodegradation. The challenges and future directions for research on polythiophene synthesis and application are also discussed.

Polythiophene-based materials have shown promise in organic photovoltaics, where they can serve as the active layer in solar cells. The absorption of light by the polymer generates excitons (electron-hole pairs), which can be separated at the heterojunction interface and contribute to the generation of electricity. Efforts have been made to optimize the efficiency and stability of polythiophene-based solar cells, making them a potential candidate for renewable energy generation. Polythiophene derivatives have emerged as promising materials for the photodegradation of organic pollutants due to their unique electronic and optical properties. The optimization of the synthesis and photocatalytic activity of these materials has led to their use in various applications, including wastewater treatment and environmental remediation. The development of polythiophene derivatives with enhanced photocatalytic activity and selectivity is expected to lead to their widespread use in the degradation of persistent organic pollutants, making them a promising alternative to traditional remediation methods. One of the notable features of polythiophene is its π -conjugated structure, which facilitates charge transport along the polymer backbone. The delocalized π -electrons enable the

flow of electrical current, making polythiophene a conductive material. By controlling the chemical structure and introducing various side groups or substituents, the electronic and optical properties of polythiophene can be fine-tuned to meet specific application requirements. Sensors are another area where polythiophene and its derivatives have shown potential. These materials have been used in the development of sensors for a wide range of applications, including environmental monitoring, medical diagnostics, and food safety. Polythiophene derivatives have been shown to be particularly effective in the detection of gases, such as carbon monoxide, and in the detection of biomolecules, such as glucose.

SYNTHESIS:

Polythiophene polymer gained significant attention in research and industrial areas because it possesses high environmental stability, better thermal stability, and less gap energy. Moreover, their interesting properties like semiconducting, electronic and optical activities along with their better mechanical characteristics and ease of processability brought significant attention to the

polythiophene composites. Due to the ability to form better contact with metal electrodes and their stability at ambient conditions². Polythiophene can be synthesized by major two types one is electrochemically by applying a potential across a solution of the monomer to be polymerized. Another one is chemically using oxidants or cross-coupling catalysts. The quality of electrochemically prepared PT thin films is affected by a number of factors. These include the electrode material, current density, temperature, solvent, electrolyte, presence of water, and monomer concentrations³. Polythiophene (PT) was synthesized by a classical chemical oxidation method. Thiophene monomer (0.5 M) was added to 100 ml of dichloromethane in three-necked round bottom flask. Freshly prepared anhydrous FeCl₃ solution in acetonitrile was mixed to the previously prepared thiophene solution under vigorous stirring. The formation of black colour precipitation confirms the polymerization of thiophene. The polymerization was allowed to proceed for a specific time with vigorous stirring. The PT was filtered and washed with acetone and acetonitrile several times until a colourless filtrate was obtained. Then the filtered PT was dried in a vacuum oven at 60°C for 24 h⁴. The synthesis of PT can be seen in fig below.

APPLICATIONS:

PHOTODEGRADATION USING PT:

The major drawback of any metal oxide-mediated photocatalysis process is the high rate of electron and hole recombination, which decreases the overall photocatalysis efficiency. Dye sensitized photocatalytic materials show high efficiency in the degradation of pollutants, where the dye acts as a sensitizer and facilitates electron transfer to the CB of TiO₂. The electron is captured to produce active radicals, such as O₂⁻, OOH and OH, which are responsible for the photodegradation process 5, 6. On the other hand, the loose attachment of dyes with the metal oxide is a major drawback, which results in poor stability for long term applications 7. Conducting polymers, such as PT in the place of dyes, is an efficient method of resolving these problems because the polymer can be coated on the surface of metal oxides, and the resulting composite would exhibit strong interactions as well as high absorption in the UV and visible region of the solar spectrum. In situ polymerization techniques have mostly been used for the fabrication of metal oxides. Zhu et al. 8 exploited the properties of the high electron mobility of PT to fabricate a PT/TiO₂ nanocomposite for the photocatalytic degradation of MO dye under UV light irradiation. A self-designed UV-irradiation instrument with 10 W germicidal lamps with a maximum wavelength of 253.7 nm was used for the catalysis process. The change in the MO concentration was measured by a UV-vis spectrophotometer and was related to the

www.presidencyuniversity.in

degradation of MO. Morphological analysis showed that during in-situ polymerization, PT is coated on the TiO₂ nanoparticles and the overall composite absorbs in the wavelength range of 200–800 nm compared to TiO₂, which absorbs only in the 400 nm region. This suggests that the PT/TiO₂ nanocomposite can be excited by solar light. In addition to the photodegradation phenomenon, the PT/TiO₂ nanocomposite also allows surface adsorption of the dye, which changes with the PT to TiO₂ weight ratio. With the increase in PT ratio, the adsorption capacity of the PT/TiO₂ nanocomposites increases first and decreases afterward, which is related to the structural features of the nanocomposite system. When tested under UV light illumination, the pure PT used as a catalyst did not show any appreciable degradation of MO (<5.0%). Pure TiO₂ showed 48.5% MO degradation, whereas PT/TiO₂ showed 56.6% degradation. The rate of degradation initially starts at a high pace after which it becomes stable due to the adsorption of dye on the active sites of the catalyst. PT/TiO₂ with a higher PT content exhibited limited catalytic activity, which is because PT adsorbed on the surface of TiO₂ occupied most of the surface active sites of TiO₂, thereby preventing the MO molecule from reaching the active sites of TiO₂ for degradation. The surface property is an important factor for the photocatalytic properties and is closely related to the PT to TiO₂ weight ratio. In another development reported previously, it was shown that with increasing PT content from 0% to 2%, the adsorption capacity of the PT/TiO₂ composites toward MO increases 9. Zeta potential studies showed that in the dispersion, the surface of the TiO₂ is negatively charged while the surface of the PT/TiO₂ composites is positively charged. Therefore, due to coulombic repulsion, MO is barely adsorbed on the TiO₂ surface. On the other hand, the positively charged surface of the PT/TiO₂ composites can adsorb MO strongly, which would contribute to the high photodegradation efficiency because it facilitates efficient interfacial charge transfer. The adsorbed MO molecules are also helpful in preventing the recombination of photoelectrons and holes 10. Therefore, the strong adsorption properties of the PT/TiO₂ composites could increase the photocatalytic degradation rate of MO 11. The PT/TiO₂ nanocomposite, when studied for its visible light activity, also showed substantial visible light photocatalytic activity. TiO₂ is excited by UV light only; hence PT acts as a sensitizer. PT because of its strong absorbance in the visible light region upon excitation transfers the electron to the CB of TiO₂. The CB electron then reacts with O₂ adsorbed on the TiO₂ surface to produce oxidative radicals

responsible for the photodegradation process.

HYDROGEN STORAGE:

Fabrication of porous carbons with optimized and tailored structural and chemical properties is key to their use in numerous emergent applications such as storage of electrical energy in supercapacitors, immobilization and separation of large biomolecules, CO₂ capture, methane or hydrogen storage, adsorption of specific contaminants in liquid phase (e. g., dyes, heavy metal ions, anions, etc), catalyst supports in fuel cells. Whereas for the immobilization and separation of large biomolecules and catalyst supports in fuel cells, mesoporous materials are regarded as the best candidates, for energy storage or gas sorption applications, microporous materials exhibit the best performance. Gas and energy storage are currently attracting much attention due to the ever-increasing demand for energy and the environmental problems caused by society's continuing dependence on fossil fuels. The Synthesis strategy to suitable hydrogen storage is the production of carbon materials with ultra-high surface area and pore volume. It is often the case that the nature of carbon precursors plays an important role in determining the textural properties of carbon materials generated via templating or activation processes. Carbon precursors can also enable the doping of heteroatoms onto templated or activated carbons. Here we present for the first time the one-step chemical activation (with KOH as activating agent) of the polymer POLYTHIOPHENE, as a way to achieving carbon materials with high surface area and large pore volume. The textural properties and chemical composition of the resulting S-doped porous carbons were tuned by modifying the activation temperature while retaining a relatively low KOH/polythiophene weight ratio of 2.

Polythiophene-derived activated carbons are one of the most attractive hydrogen storage products present in the world.¹²

WATER PURIFICATION:

Contamination of water with pollutants that are toxic and/or carcinogenic has led to serious and irreversible consequences to the quality and safety of the water that we consume on a daily basis. This has led to extensive research worldwide to find immediate and effective solutions to this problem. One such practically efficient solution is the treatment of contaminated water for the removal of added contaminants. Among the materials used for water treatment, adsorbents

www.presidencyuniversity.in

and photocatalysts have been used extensively since they are easy to fabricate, functionalize and use, and they demonstrate high removal efficiencies. Recently polythiophene and its derivatives,

as well as modified composites of polythiophene and its derivatives, have emerged as extremely promising adsorbent and photocatalyst materials. These materials possess high charge density, surface area and a number of sites to interact and adsorb pollutants. Polythiophene, as a material, belongs to the category of chemical materials that possess conjugated aromatic ring structures. It can be easily functionalized in its 3 and 4 positions to give rise to a multitude of polythiophene derivatives, most notably poly(3-methylthiophene), poly(3-hexylthiophene) (P3HT) and poly(3,4-propylenedioxythiophene), which have been collectively referred to here as polythiophenes. Oxidative polymerization of thiophene monomer gives rise to the formation of positively charged polythiophene. However, the charge on the polymer can be desirably modulated by proper subsequent treatment. For example, at alkaline pH (higher than 8.5), polythiophene exhibits negative zeta potential versus the positive zeta potential demonstrated at pH values less than 8.5. In addition, polythiophenes are easily synthesizable materials that can be readily scaled up and are cost-effective and environmentally stable. polythiophenes possess appropriate molecular structure, high charge density, surface area and the number of sites to effectively interact with the pollutant materials; Thus, makes these products a class of promising efficient adsorbent and photocatalytic materials.¹³

CONCLUSION:

PT and its derivatives may have a vital role in modifying electrode and as active layer for the chemical sensor materials due to their thermal stability, excellent optical and electrical characteristics while retain good mechanical properties. However, some drawbacks such as poor stability, solubility, and low yield. Remarkably, the hybridised with of another nanomaterial like graphene, carbon nanotubes and metal oxide into the PT matrix enhances the electrochemical stability of the sensor compared to similar nanomaterials without the nanocomponent and also the conductive polymer itself. Therefore, the combination of conductive fillers such as carbon nanomaterials and inorganic nanoparticles in a polymer matrix is very strategic for sensor efficiency. Combining the features of these three materials into a single material enhances the mechanical properties and sensor performance. The nanocomponent promotes the charge transfer, increases the active sites of the modified electrode

SCHOOL of ENGINEERING DEPARTMENT OF CHEMISTRY

Ref.No.:PU/SOE/CHE /Peer-learning class/2022-23/1st & 2nd year/CHE 1020

Course Title: Environmental Studies and Sustainable Development

Course Code: CHE 1020

Name of the Instructor in Charge: Dr. Saravanan C

Name of the Instructor: Dr. Saravanan C

Subject: Peer-learning classes for Slow learners taught by advanced learners

Sl. No	Topics Covered	Date and Time	Link/Venue
1	Module-3: Discussed about solid waste management (plastics, domestic waste) – 3R's principles; Climate disruption, global warming, and ozone depletion.	17 May 2023, 1 PM – 3 PM	Offline/DT05
2	Module-4: Discussed about energy resources- Renewable and non-renewable, efficiency and conservation. Sustainable strategies for conservation of natural resources.	24 May 2023, 1 PM – 3 PM	Offline/ DT05

City Office: University House, 8/1, King Street, Richmond Town, Bengaluru - 560025

Campus: Presidency University, Itgalpur, Rajankunte, Bengaluru - 560064

Solid Waste Management

Useless or worthless material, Stuff to be thrown away

- The world book dictionary

Waste is any subject or the object which the holder discards or intends or is required to discard

Sources

- Urban waste – medical waste from hospitals; municipal solid waste from homes, offices, markets, horticulture waste from parks, gardens, orchards, etc.,
- Waste from homes (domestic waste): polythene bags, empty metal and aluminium cans, scrap metals, glass bottles, waste papers, dippers, clothes, food waste, etc.,

Activate Windows

Green house effect

- Meaning: Progressive warming up of the earth surface due to high concentration of manmade carbon dioxide in the atmosphere.
- Concentration of CO₂ works like a glass panel of greenhouse allowing short wave incoming solar radiation to come in but preventing the long wave heat to re-radiated out.

Green house gases

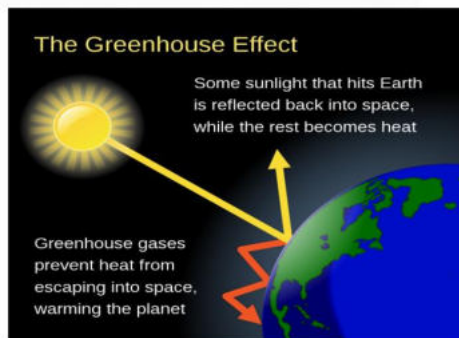

Water vapor

CO₂

Methane

Nitrous Oxide (N₂O)

Ozone and CFCs
